**CERTIFICATE**

This is to certify that the Lab work entitled “Artificial Intelligence (23CS5PCAIN)” carried out by **Sanketh M Hanasi (1BM22CS242)**, who is bonafide student of **B.M.S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Artificial Intelligence (23CS5PCAIN) work prescribed for the said degree.

## Program 1

Implement Tic - Tac - Toe Game

Implement vacuum cleaner agent

Algorithm:

Example:

1)

x	0	x	0	x	0	
		x	0		x	
				x		

x wins

2)

x		x	0	x	x	0	x	
	0		0		0	0	x	0
				x				
					x	0	0	x

Drew

1/10/24

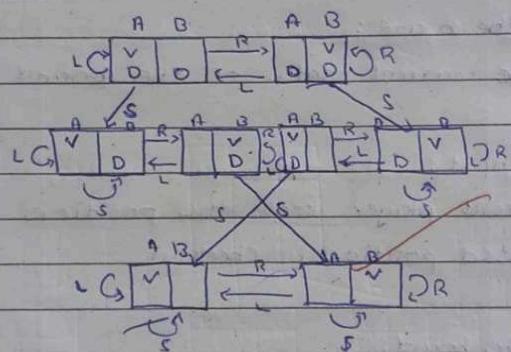

2) Implement vacuum world problem

function REFLEX-VACUUM-AGENT(LOCATION, STATUS) returns an action

if status = Dirty then return Suck  
else if location = A then return Right  
else if location = B then return Left

state space diagram of vacuum world

function simple.

Problem formulation steps :

States

Initial state

Actions

Transition model

Goal test

Path cost

Algorithm :

- 1) Initialize room and cost
- 2) Check the room are clean or not  
If room is dirty clean the room and move to the next location.
- 3) Next check whether previously cleaned is room is dirty if dirty clean.
- 4) If both the rooms are clean then return the total cost and off the vacuum cleaner

D  
W/M  
H/W

Code: 1: Tic - Tac - Toe

```
import numpy as np
board=np.array([['-','-','-'],['-','-','-'],['-','-','-']])
current_player='X'
flag=0

def check_win():

```

## Program 2

Implement 8 puzzle problems using Depth First Search (DFS)  
 Implement Iterative deepening search algorithm

Algorithm:

3) Solve 8 puzzle problem using DFS & BFS.

BFS:

- The initial state & goal state will be given.
- We need to achieve goal state of 8 puzzle using BFS algorithm.
- Initially the parent node will be the initial state, possible movements of blank space will be recorded i.e., up, down, right, left.
- These possible movements will be the child nodes of initial state.
- Define helper function findBlankTile(state) to locate the position of blank tile
- Define another function getpossiblemoves(state) that generates all valid moves for the current state.
- Determine the position of the blank tile.
- For each possible direction (up, down, left, right), record direction & move the tile.
- Run the BFS loop until we reach the goal state.

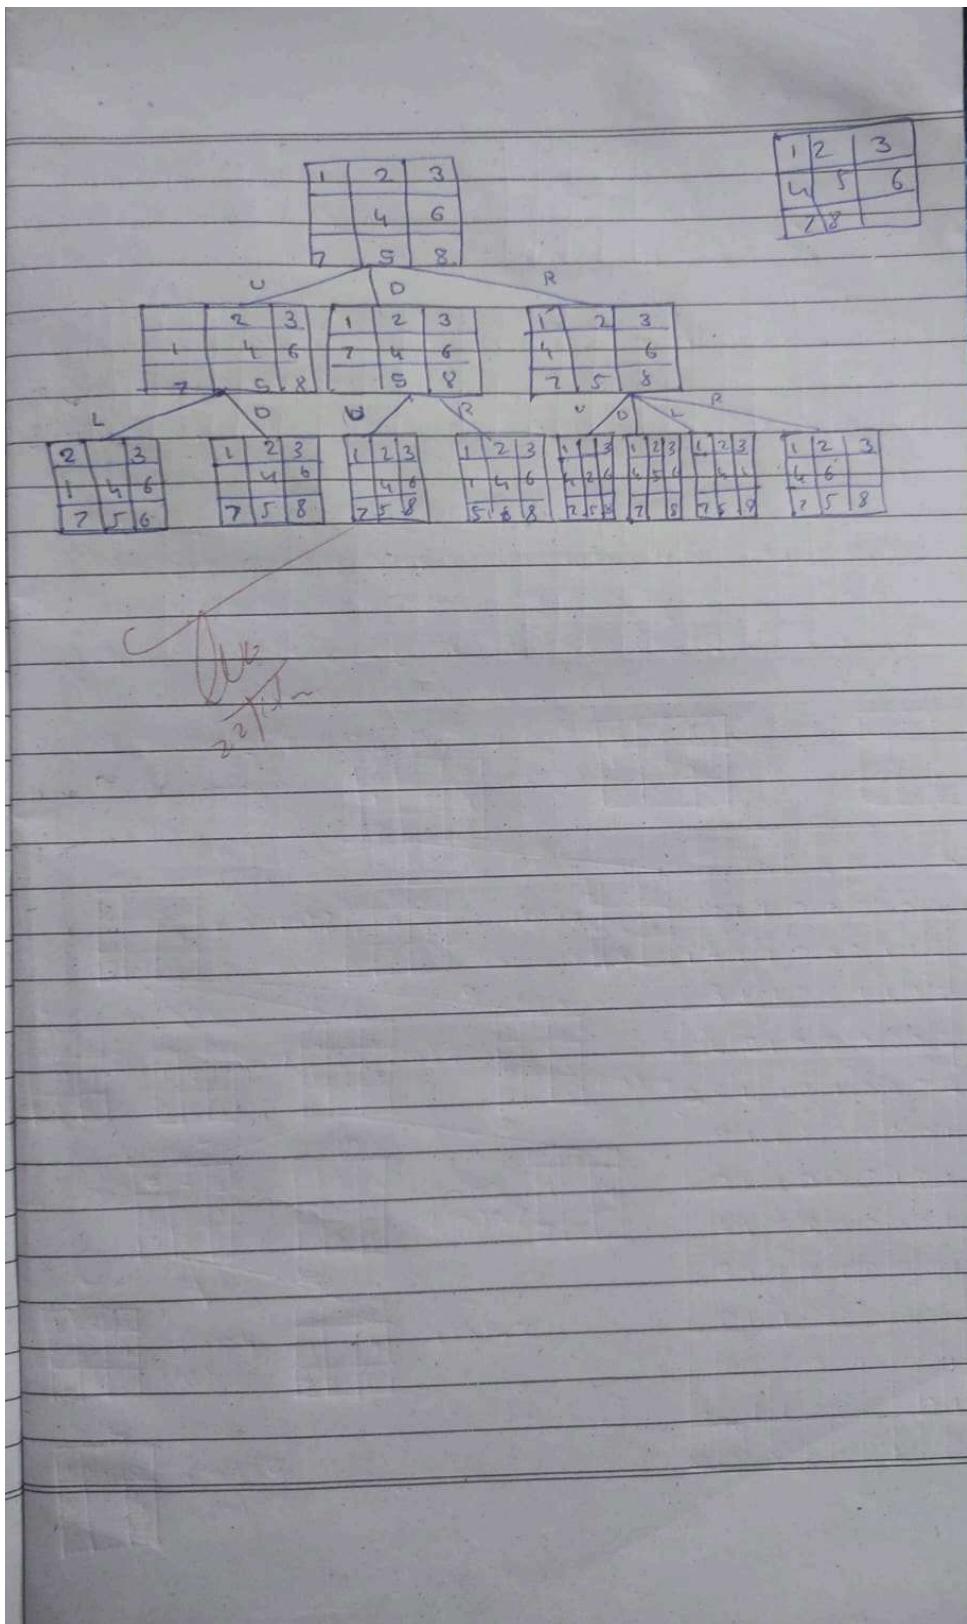

Y  
H  
t  
n

Lab 5: Implement Iterative Deepening Search Algorithm.

- 1) For each child of the current node
- 2) If it is the target node return
- 3) If the curr max depth is reached return
- 4) Set the current node to this node & go back to 1
- 5) After having gone through all children go to the next child of the parent (the next sibling)
- 6) After having gone through all children of the start node increase the maximum depth & go back to 1
- 7) If we have reached all leaf (bottom) nodes, the goal back doesn't exist.

function Iterative-Deepening-Search (<sup>(problem)</sup>  
or failure)

```
for depth = 0 to ∞ do  
    result ← Depth-limited-search (problem, depth)  
    if result ≠ cutoff then return result
```

Code:

## Program 3

Implement A\* search algorithm

Algorithm:

### Manhattan Distance:

- 1) Define goal state & also create a dictionary.
- 2) Create a list containing  $f(n)$ ,  $g(n)$  & path with  $h(n) = 0$ .

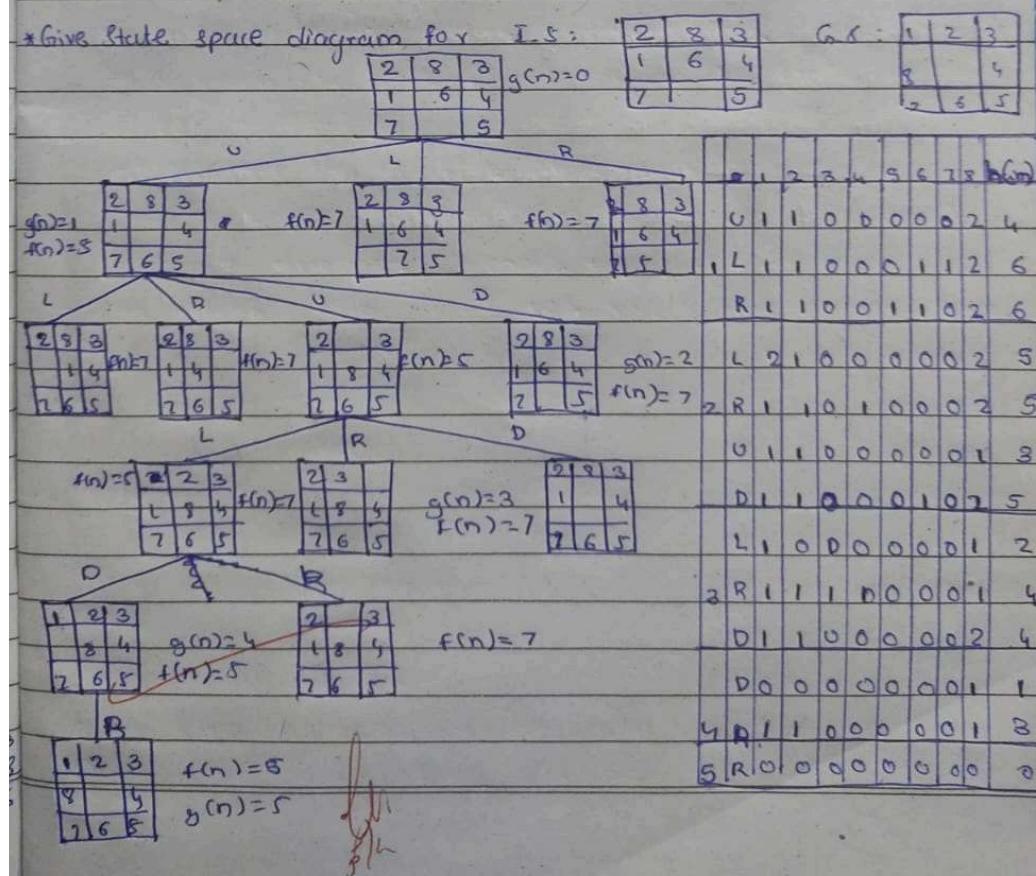

Define a closed set to track visited states.

- 3) calculate manhattan distance,

- for each tile from 1 to 8 in current state
- find this current position & find target by goal state & calculated distance.
- sum these distances to get  $h(n)$ .

- 4) Expand nodes, while list is not empty, extract node with low frequency & return path.

\* Give state space diagram for 1-5:

Code:

Misplaced Tiles :

```
class Node:  
    def __init__(self, state, parent=None, move=None, cost=0):  
        self.state = state  
        self.parent = parent  
        self.move = move  
        self.cost = cost  
  
    def heuristic(self):  
        goal_state = [[1,2,3], [8,0,4], [7,6,5]]

## Program 4

Implement Hill Climbing search algorithm to solve N-Queens problem

Algorithm:

a) Hill climbing search Algorithm to solve N Queens problem

Hill climbing search Algorithm :

```
function HILL-CLIMBING(problem) returns a state that is a local maximum
    current ← MAKE-NODE(problem, INITIAL-STATE)
    loop do
        neighbour ← a highest-valued successor of current
        if neighbour.Value ≤ current.Value then return
            current.STATE
        current ← neighbour
```

Problem Formulation :

- State :  $n$  queen on the board one queen per column
- Variables :  $x_0, x_1, x_2, x_3$  - where  $x_i$  is the new position of the queen in column  $i$ . Assume that there is one queen per column.
- Domain for each variable  $x_i \in [0, 1, 2, 3] \forall i$

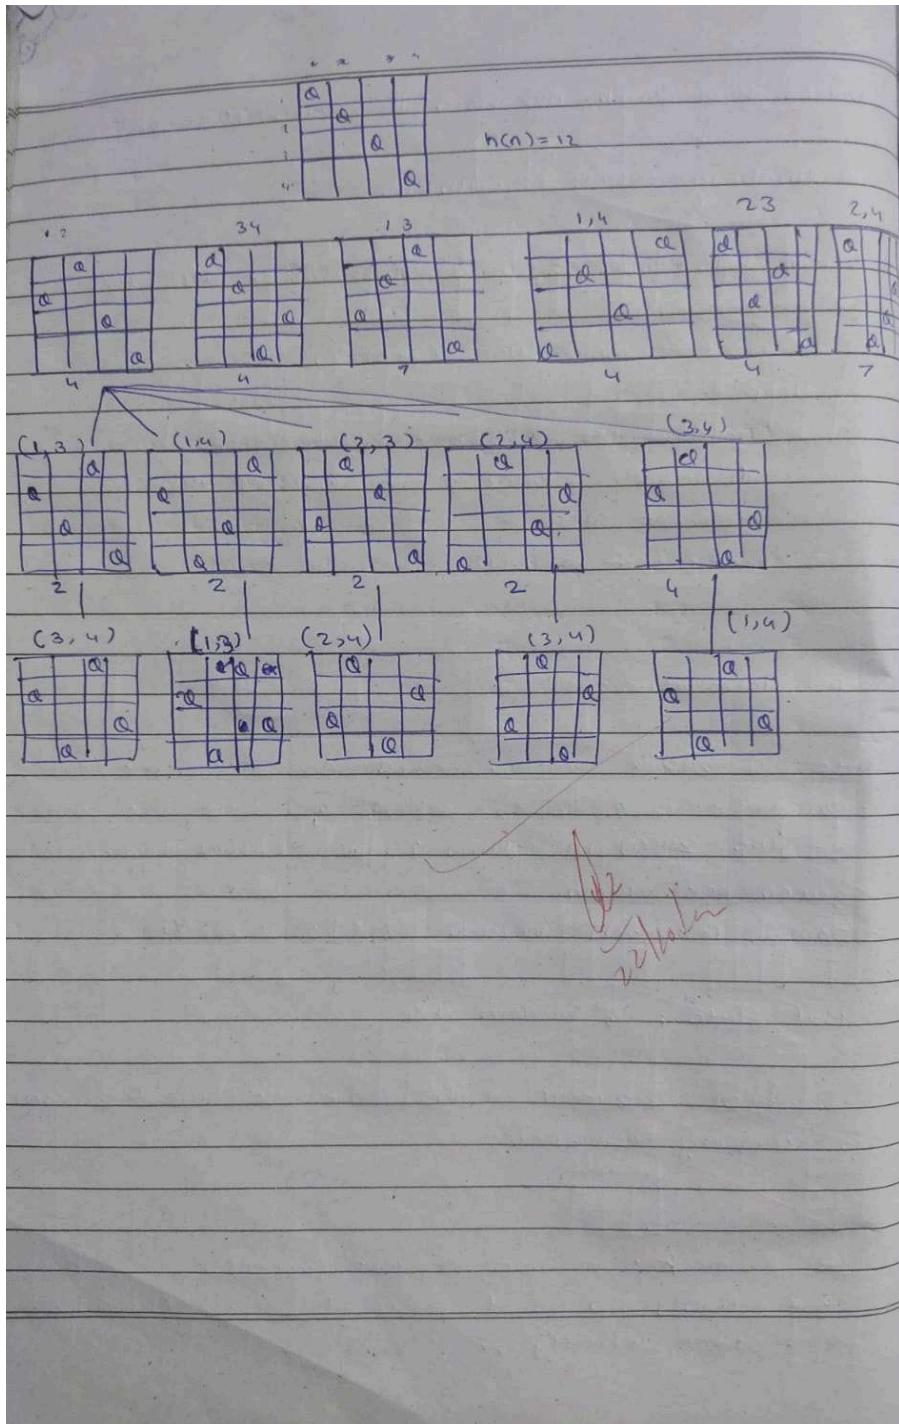

• Initial state : a random state

• Goal state :  $n$  queen on the board. No pair of queens are attacking each other.

• Neighbour relation :

- swap the position of two queens

• cost function : The no of pairs of queens attacking each other, directly or indirectly.

Code:

```
import random
def calculate_cost(board):

    n = len(board)

    attacks = 0

    for i in range(n):

        for j in range(i + 1, n):

            if board[i] == board[j]: # Same column

                attacks += 1

            if abs(board[i] - board[j]) == abs(i - j): # Same diagonal

                attacks += 1

    return attacks

def get_neighbors(board):

    neighbors = []

    n = len(board)

    for col in range(n):

        for row in range(n):

            if row != board[col]: # Only change the row of the queen

                new_board = board[:]

                new_board[col] = row

                neighbors.append(new_board)

    return neighbors
```

```

## Program 5

Simulated Annealing to Solve 8-Queens problem

Algorithm:

29/10/24

6)

a) Write a program to implement simulated Annealing Algorithm.

function SIMULATED-ANNEALING(problem, schedule) returns  
a solution state

inputs: problem, a problem  
schedule, a mapping from time to "temperature"

current ← MAKE-NODE(problem, INITIAL-STATE)

for  $t=1$  to  $\infty$  do

$T \leftarrow \text{schedule}(t)$

    if  $T = 0$  then return current

    next ← a randomly selected successor of current

$\Delta E \leftarrow \text{next.VALUE} - \text{current.VALUE}$

    if  $\Delta E > 0$  then  $\text{current} \leftarrow \text{next}$

    else  $\text{current} \leftarrow \text{next}$  only with probability  $e^{\Delta E/T}$

SA - Steps :

1. Start at a random point  $x$
2. Choose a new point  $x_j$  on a neighborhood  $N(x)$
3. Decide whether or not to move to the new point  $x_j$ , the decision will be made based on the probability function  $P(x, x_j, T)$

$$P(x, x_j, T) = \begin{cases} 1 & , F(x_j) \geq F(x) \\ e^{\frac{F(x_j) - F(x)}{T}} & , F(x_j) < F(x) \end{cases}$$

4. Reduce  $T$

## 8-Queens Problem

Output:

The best position found is : [4 0 2 5 2 6 1 3]

The number of queens that are not attacking each other is 8.0

TSP :

result structure : ( array ([1, 0, 3, 5, 4, 2]),  
21.02934853206, None )

Best route found : [ 1 0 3 5 4 2 ]

Total distance of best route : 21.02934853206

Qub

## Program 7

Implement unification in first order logic

Algorithm:

LAB-7

b) Implement Unification in First Order Logic

Algorithm: Unity ( $\Psi_1, \Psi_2$ )

Step 1: If  $\Psi_1, \Psi_2$  is a variable or constant then :

- If  $\Psi_1$  or  $\Psi_2$  are identical, then return NIL.
- Else if  $\Psi_1$  is a variable,
  - then if  $\Psi_1$  occurs in  $\Psi_2$ , then return FAILURE
  - Else return  $\{(\Psi_2/\Psi_1)\}$ .
- Else if  $\Psi_2$  is a variable
  - if  $\Psi_2$  occurs in  $\Psi_1$ , then return FAILURE
  - Else return  $\{(\Psi_1/\Psi_2)\}$ .
- Else return FAILURE

Step 2: If the initial Predicate symbol in  $\Psi_1$  and  $\Psi_2$  are not same, then return FAILURE.

Step 3: If  $\Psi_1$  &  $\Psi_2$  have a diff no of args, then return FAILURE

Step 4: Set Substitution set (SUBST) to NIL.

Step 5: For i=1 to the no of ele in  $\Psi_1$ ,

- Call unify function with the ith ele of  $\Psi_1$  & ith ele of  $\Psi_2$  & put the result into S
- If S = failure then return Failure
- If S ≠ NIL then do,
  - Apply S to the remainder of both L1 & L2
  - SUBST = APPEND(S, SUBST)

Step 6: Return SUBST.

Step 7: Output the result + Compose it one by one.

$p(x, F(y)) \rightarrow ①$

$p(a, F(g(x))) \rightarrow ②$

① & ② are identical if  $x$  is replaced with  $a$  in ①  
 $p(a, F(y)) \rightarrow ①$

if  $y$  is replaced with  $g(x)$

$p(a, F(g(x))) \rightarrow ①$

$q(a, g(x, a), f(y)) \rightarrow ①$

$q(a, g(f(a), a), x) \rightarrow ②$

$f(b)$  is replaced with  $x$  in ②

$q(a, g(x, a), x)$

$x$  is replaced with  $f(y)$  in ②

$q(a, g(x, a), f(y)) \rightarrow ①$

$$① \Psi_1 = p(f(a), g(y)) \quad \Psi_2 = p(x, x)$$

$\rightarrow \text{SUBST } (+a/x)$

$$\Psi_1 = p(f(a), g(y)) \quad \Psi_2 = p(+a, f(a))$$

$\rightarrow \text{SUBST } (f(a)/g(y))$

Failed

$$② \Psi_1 = p(b, x, f(g(z))) \quad \Psi_2 = p(z, f(y), f(y))$$

$\rightarrow \text{SUBST } (b, z)$

$$\Psi_1 = p(b, x, +g(b)) \quad \Psi_2 = p(b, f(y), f(y))$$

$\rightarrow \text{SUBST } (f(y), x)$

$$\Psi_1 = p(b, f(y), +g(b)) \quad \Psi_2 = p(b, *y, &e(y, f(y)))$$

subst  $f(g(b))$

$$\psi_1 = p(b, f(g(b)), f(g(b)))$$

$$\psi_2 = p(b, f(g(b)), f(g(b)))$$

~~$\psi_1 \wedge \neg \psi_2$~~

## Program 8

Create a knowledge base consisting of first order logic statements and prove the given query using forward reasoning.

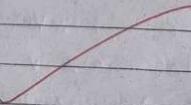

Algorithm:

LAB-8

(a) Create a knowledge base consisting of FOL statements  
to prove the given query using forward reasoning

function FOL-FC-ASK (KB, a) returns a substitution or false  
input : KB, the knowledge base, a set of first order  
definite clauses  
d, the query, an atomic sentence  
local variables : new, the new sentences inferred on  
each iterations

repeat until new is empty  
new ← {}  
for each rule in KB do  
 $(p_1 \wedge \dots \wedge p_n \Rightarrow q) \leftarrow \text{STANDARDIZE-VARIABLES}(\text{rule})$   
for each rule  $\theta$  such that  $\text{SUBST}(\theta, p_1 \wedge \dots \wedge p_n) \in \text{SUBS}$   
 $(\theta, p'_1 \wedge \dots \wedge p'_n)$   
for some  $(p'_1 \wedge \dots \wedge p'_n)$  in KB  
 $q' \leftarrow \text{SUBST}(\theta, q)$   
if  $q'$  does not unify with some sentence already  
in KB or new then  
add  $q'$  to new  
 $d \leftarrow \text{UNIFY}(q', d)$   
if  $d$  is not fail then return  $d$   
add new to KB  
return false

Representation in FOL:

It is a crime for an American to sell weapons to hostile nations.

Let's say  $P$ ,  $q$  &  $r$  are variables

$\text{American}(p) \wedge \text{weapon}(q) \wedge \text{sell}(p, q, r) \wedge \text{Hostile}(r) \Rightarrow \text{Criminal}(p)$

→ country A has some missiles

$\# \exists x \text{ owns}(A, x) \wedge \text{missile}(x)$

Existential Instantiation : Introducing a new constant  $T_1$  :  $\text{Owns}(A, T_1)$ ,  $\text{missile}(T_1)$

→ All the missiles were sold to country A by Robert

$\# \forall x \text{ Missile}(x) \wedge \text{owns}(A, x) \Rightarrow \text{sell}(Robert, x, A)$

→ Missiles are weapons :  $\text{Missiles}(x) \Rightarrow \text{weapons}(x)$

→ Robert is an American :  $\text{American}(Robert)$

```

Output :

```

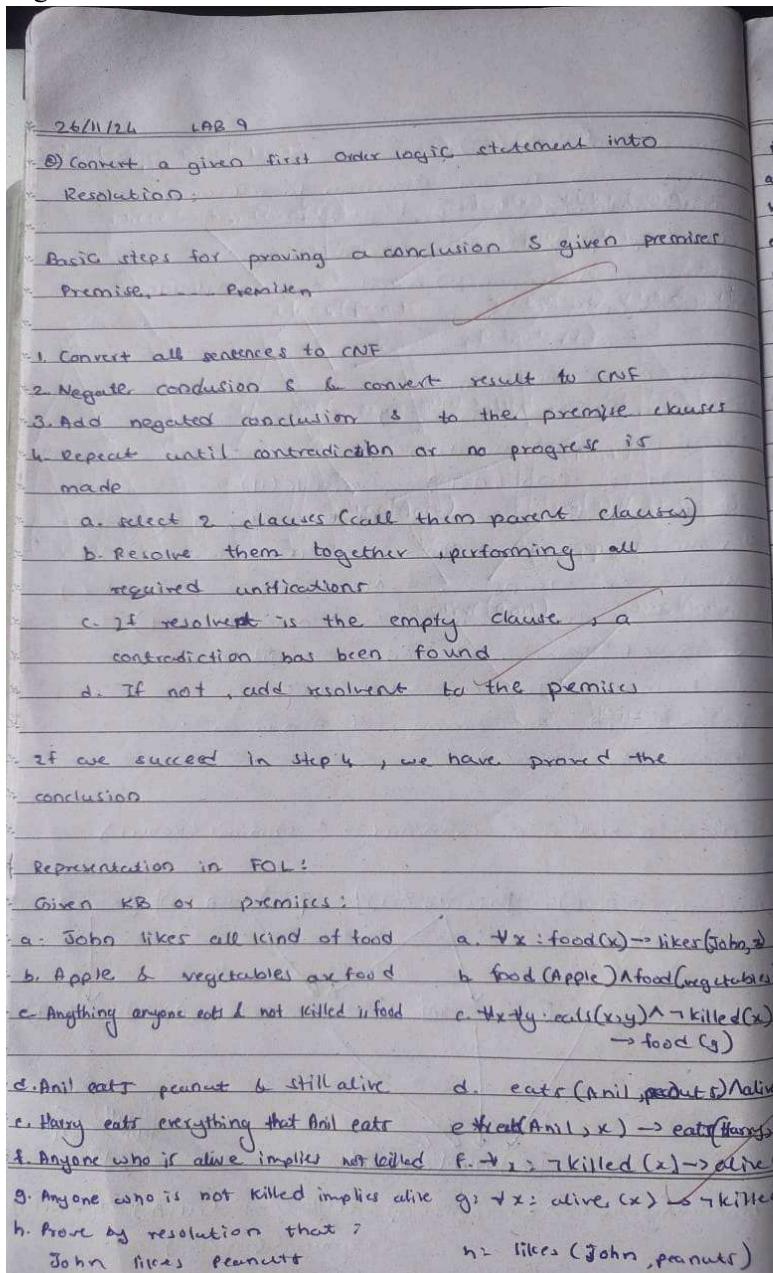

Inferred: Weapon(T1)
Inferred: Hostile(A)
Inferred: Sells(Robert, T1, A)
Inferred: Criminal(Robert)
Conclusion: Robert is a criminal.

```

## Program 9

Create a knowledge base consisting of first order logic statements and prove the given query using Resolution

Algorithm:

i) Eliminate Implications:

- a)  $\forall x \neg \text{food}(x) \vee \text{likes}(\text{John}, x)$
- b)  $\text{food}(\text{apple}) \wedge \text{food}(\text{vegetables})$
- c)  $\forall x \forall y \neg [\text{eats}(x, y) \wedge \neg \text{killed}(x)] \vee \text{food}(y) \rightarrow \forall x \forall y \neg \text{eats}(x, y) \vee \neg \text{killed}(x) \wedge \text{food}(y)$
- d)  $\text{eats}(\text{Anil}, \text{Peanuts}) \wedge \text{alive}(\text{Anil})$
- e)  $\forall x \neg \text{eats}(x, z) \vee \text{eats}(\text{Harry}, z)$
- f)  $\forall x \neg [\text{killed}(x)] \vee \text{alive}(x)$
- g)  $\forall x \neg \text{alive}(x) \vee \neg \text{killed}(x)$
- h)  $\text{likes}(\text{John}, \text{Peanuts})$

ii) Move Negation ( $\neg$ ) inwards & write

3) Rename variables, or standardize variables

- a)  $\forall x \neg \text{food}(x) \vee \text{likes}(\text{John}, x)$
- b)  $\text{food}(\text{apple}) \wedge \text{food}(\text{vegetables})$
- c)  $\forall x \forall y \neg \text{eats}(x, y) \vee \text{killed}(y) \vee \text{food}(z)$
- d)  $\text{eats}(\text{Anil}, \text{Peanuts}) \wedge \text{alive}(\text{Anil})$
- e)  $\forall x \neg \text{eats}(x, w) \vee \text{eats}(\text{Harry}, w)$
- f)  $\forall y \neg [\text{killed}(y)] \vee \text{alive}(y)$
- g)  $\forall k \neg \text{alive}(k) \vee \neg \text{killed}(k)$
- h)  $\text{likes}(\text{John}, \text{Peanuts})$

4) Drop Universal Quantification

- a.  $\neg \text{food}(x) \vee \text{likes}(\text{John}, x)$
- b.  $\text{food}(\text{apple})$
- c.  $\text{food}(\text{vegetables})$
- d.  $\neg \text{eats}(y, z) \vee \text{killed}(y) \vee \text{food}(z)$
- e.  $\text{eats}(\text{Anil}, \text{Peanuts})$
- f.  $\text{alive}(\text{Anil})$
- g.  $\neg \text{eats}(\text{Anil}, w) \vee \text{eats}(\text{Harry}, w)$
- h.  $\text{killed}(y) \vee \text{alive}(y)$
- i.  $\neg \text{alive}(k) \vee \neg \text{killed}(k)$
- j.  $\text{likes}(\text{John}, \text{Peanuts})$

Proof by Resolution:

$\neg \text{likes}(\text{John}, \text{Peanuts})$

$\neg \text{fed}(x) \vee \text{likes}(\text{John}, x)$

{Peanuts/z}

$\neg \text{fed}(\text{Peanuts})$

$\neg \text{eats}(y, z) \vee \text{killed}(y) \vee \text{fed}(y)$

{Peanuts/z}

$\neg \text{eats}(y, \text{Peanuts}) \vee \text{killed}(y) \quad \text{eats}(\text{Anil}, \text{Peanuts})$

{Anil/y}

$\text{killed}(\text{Anil})$

$\neg \text{alive}(k) \vee \neg \text{killed}(k)$

{Anil/k}

$\neg \text{alive}(\text{Anil})$

$\text{alive}(\text{Anil})$

{3 Hence proved.

QED  
3/2/24
